5. Requirements Elicitation Techniques

Our group selected interviews and questionnaires because they help collect different types of requirements from different stakeholders.

5.1 Interviews – Lecturers

Target group: Lecturers.

Reason for selection: Interviews allow the team to ask detailed questions and follow up on problems lecturers experience when assessing practical work across different student computers.

Example questions:

1. What problems do you experience when students use different computers?
2. Which learning tools do students need for practical lessons?
3. How do you currently assess practical assignments?
4. What information should the system provide about student tool sessions?
5. What features would help you assess practical work more consistently?

5.2 Questionnaires – Students

Target group: Students.

Reason for selection: Questionnaires allow the team to collect information from many students efficiently. Students can report their computer limitations, preferred learning tools, access difficulties, and expectations for the platform.

Example questions:

1. Do you experience difficulties installing learning tools on your computer?
2. Which learning tools do you use most often?
3. Would you prefer accessing learning tools through a web browser?
4. How often do you experience software compatibility problems?
5. What information would you like to see when requesting a tool session?
